

Server Infrastructure Proposal (VLWorkHub Project)

Objective

Deploy an internal server solution to host VLWorkHub platforms (HR, Care, URSafe), store company data securely, and provide backup and recovery capabilities.

Required Equipment

- Synology DiskStation DS1522+ (5-bay NAS)
- 32GB ECC RAM Upgrade
- 4 × 8TB NAS Hard Drives (Seagate IronWolf or WD Red Plus)

Storage Configuration

Total: 32TB raw storage

Usable: ~24TB (RAID SHR-1)

Protection: 1 drive failure tolerance

System Capabilities

- Host VLWorkHub websites (vlworkhub.ca, care, hr, ursafe)
- Run Ubuntu Virtual Machine
- Store documents, contracts, and application data
- Centralize company file storage

Benefits

- Full control over company data
- Reduced dependency on cloud services
- Secure access and permissions
- Scalable storage for future growth

Backup Strategy

- NAS will back up virtual machines and files
- Future external HDD/SSD backup for disaster recovery

Risks & Considerations

- RAID is not a backup solution (external backup required)
- Initial setup requires configuration
- Performance suitable for internal applications (not heavy public traffic)

Summary

This solution provides a reliable, scalable, and secure infrastructure to host internal applications, manage company data, and ensure business continuity through backup and recovery.
