Hi Ismail,

The Test upgrade to Sage v2026 on the new RDS server (VT1-NEW) is now completed.

Once access to the new server is provided to whomever will be doing to user testing, please follow the steps below to access the Sage program.

With v2026, Sage now uses enhanced security and complex passwords. As such, you Sage passwords will need to be updated. Right now, only the ADMIN user has been updated. For any Sage user other than ADMIN, they will need to update their Sage user password on the new server.

I will send you the updated ADMIN password via secure link shortly. ****Please do not change this password as it is required for our access to the system and the live upgrade later on****

For all other Sage users, on first login, they will be prompted to change their existing Sage password (if it does not already meet the new requirements listed below)

- **Must be a minimum of 8 characters**
- **Have “at least” one upper case, one lower case, one number and one special character (i.e. @, #, etc.). Note that some special characters may be reserved by the system, but it would prompt you if that was the case.**
- **Cannot start with a number**

If anyone has a problem accessing or updating their password, you can log on as the ADMIN user to update it for them by going to “Administrative Services -> Users” select the user and enter (and verify) a new password for them. If anyone still has any issues, let me know.

****Note** that these updated Sage passwords are for the new server only – usernames will be the same, but you will continue to use your existing passwords in your current production environment until the go live upgrade is done later. After that, users will use the new complex passwords only.

Remember that this is a test “copy” and not live data so anything entered here will not be reflected in your current production (live) environment. Please let us know if you have any questions or issues access the new environment or the Sage application.

Additional notes:

Email configuration:

Under Common Services, below are the current email settings as they are on the current production environment, but these will not work and need to be updated for v2026.

The two options are SMTP and Microsoft Graph.

For SMTP to work, you may need to update the details below or setup an SMTP relay service. Alternatively, since you are using Office 365, you can change this to use Microsoft Graph setup. If you want, I can send you a document on how to set this up as it requires someone with access to your Microsoft 365 account access and uses different setup options once the Email service option changes)

If this is old information and nothing is being emailed directly out of Sage anymore, then you can ignore this.

The screenshot shows a software window titled "VDADAT - Company Profile" with a menu bar containing "File" and "Help". Below the menu bar are three tabs: "Address", "Options", and "Email", with "Email" being the active tab. The "Email" tab contains a "Settings" section with the following fields:

- Email Service:** A dropdown menu currently set to "Basic Authentication SMTP".
- Server Name:** A text field containing "outlook.office365.com".
- Server Port:** A text field containing "587" and a checkbox labeled "Use SSL" which is checked.
- User Name:** A text field containing "donotreply@vdacl.ca".
- Password:** A text field with masked characters (dots).
- From Email Address:** A text field containing "donotreply@vdacl.ca".
- Send Copies To:** A text field containing "bfredrickson@vdacl.ca".

Please let us know if you have any questions or issues.

Thanks,

Scott Seyffert |Senior Technical Consultant
